

### South Africa (White) - The probabilities of a hip fracture in women

The following tables give the 10-year probability (%) of a hip fracture according to the T-score for femoral neck BMD, the number of clinical risk factors (CRF) and age. Each table provides a mean estimate and a range, based on the epidemiology of South Africa (White). The range is not a confidence interval, but because the weight of different risk factors varies, is a true range.

Note that the BMI is set at 24 kg/m<sup>2</sup>

Age = 50 years

| Number of CRFs | BMD T-score (femoral neck) |               |               |               |               |               |               |               |               |               |               |
|----------------|----------------------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|
|                | -4.0                       | -3.5          | -3.0          | -2.5          | -2.0          | -1.5          | -1.0          | -0.5          | 0             | 0.5           | 1.0           |
